Message from the Editors

Welcome to the inaugural issue of CYBERSECURITY. This new journal aims at meeting the growing demands for understanding and addressing new security threats to real-world computing systems, from those relevant to our daily life (such as mobile phones) to the infrastructures critical to the national security. Security has been an ever-evolving effort. Research in this area always rides on new technological waves, seeking new challenges and opportunities on the technological frontier. This trend has also been witnessed in the recent progress of Artificial Intelligence (AI), as well as other fast expanding areas such as IoT, blockchains, cloud computing and big data. This new journal aims to capture the advancing research developments, bringing the audience with the latest research outcomes which may provide computing systems with better protection, or help better understand and address the emerging risks that come with the technique advances.

More specifically, CYBERSECURITY aims to report new ideas and techniques on any security and privacy-related topics, which includes but is not limited to network security, systems security, AI security, data security, software security, hardware security, data privacy and so on.

We are honored to have well-respected security experts around the world to serve as our editorial board members and we are fully committed to achieve a high impact journal with excellent publications. In this year, we are planning three special issues on the topics of system security, AI security and hardware security. Sign up to our article alert and keep yourself updated with the latest publications.

We hope this journal bridges the communications in the research communities and we look forward to your submissions, advice and feedback!
